Automation Scripting in Maximo 7.5

Aug 25, 2011

Jason Uppenborn, Ontracks Consulting

- 1 What is Automation Scripting?
- 2 How Launch Points are related
- 3 Working with Automation Scripts
- 4 Demonstration

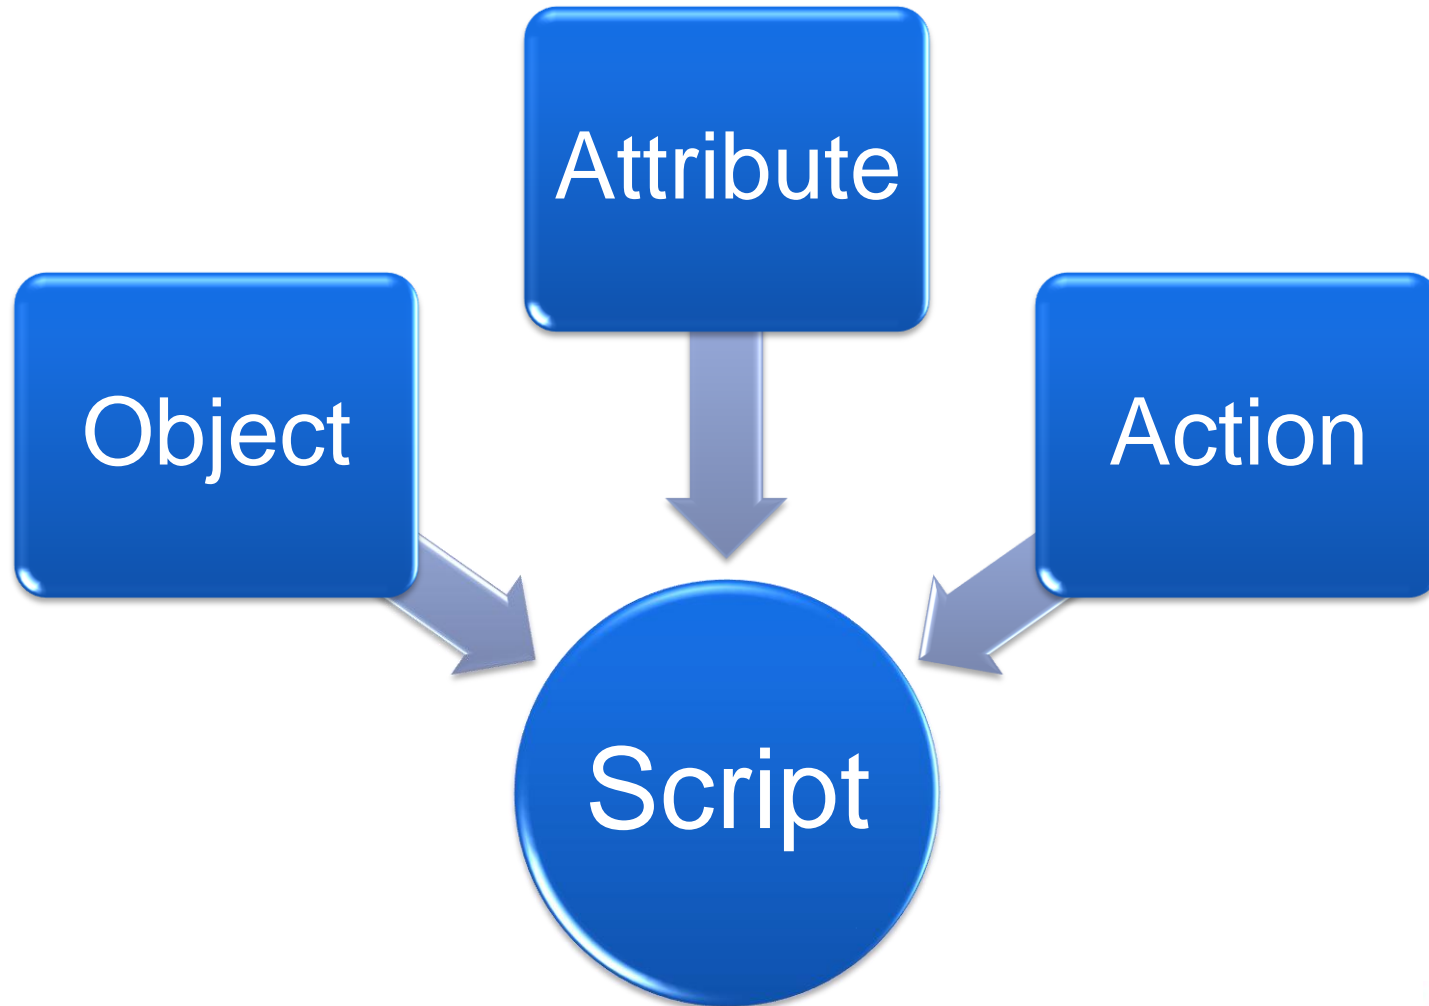

What is Automation Scripting

- New feature in Maximo 7.5
- Enables use of “autoscripts” to
 - **Calculate field values**
 - **Set data flags, such as read-only or required**
 - **Perform complex field validation**
- Scripts execute server-side
- Alternative to Java customisation
- Slight preference for Jython

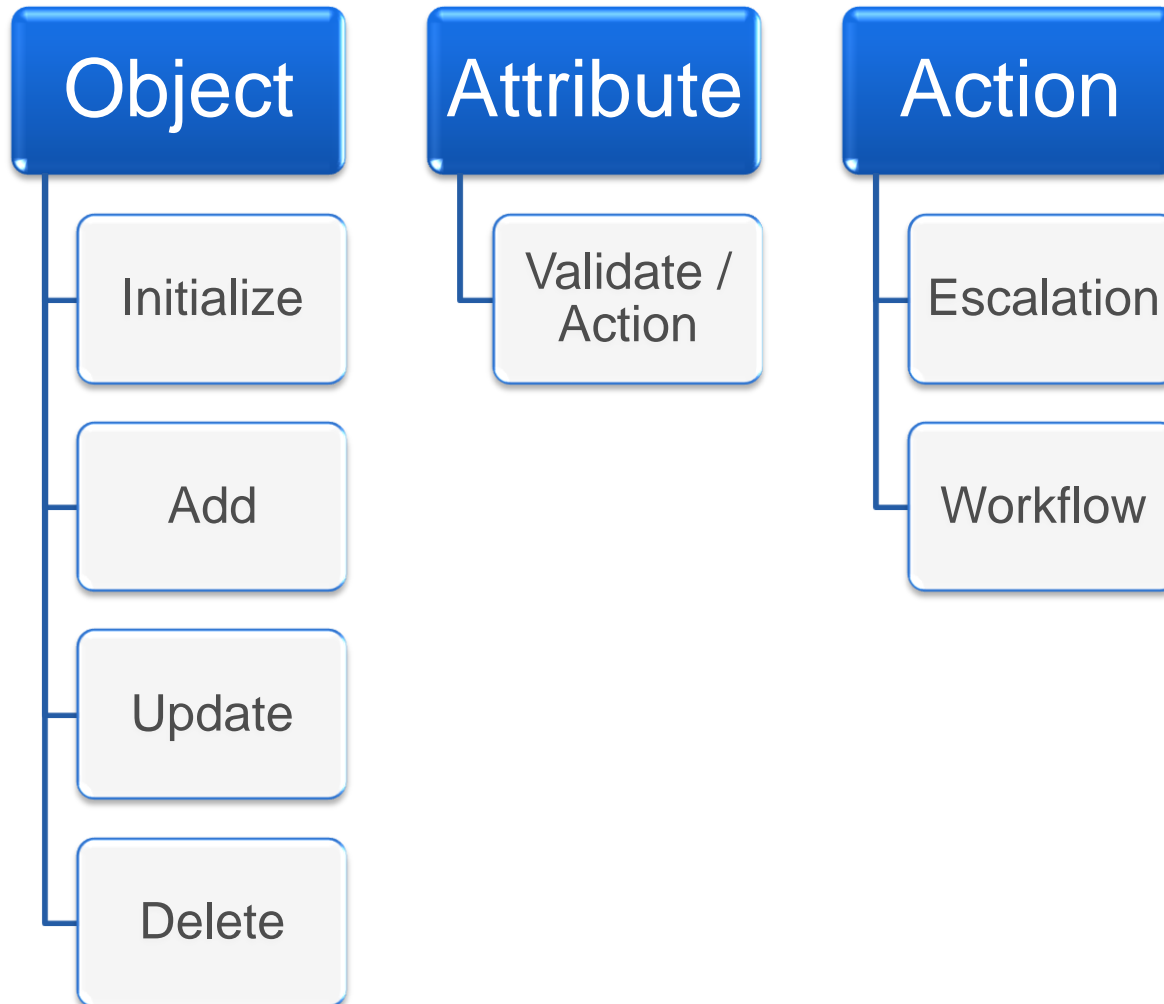

What is Automation Scripting

- Compared with Java customization
 - Configuration / Customisation
 - Implementation
 - Deployment
 - Development
 - Maintenance
 - Upgrading
 - Performance
 - Troubleshooting
 - Maturity

How Launch Points are related

How Launch Points are related

Working with Automation Scripts

- Separate editor
 - Syntax highlighting
 - Version control
 - Light weight
- Variables
 - For improved, cleaner reusability
- Reference Material
 - “JavaDocs” for Maximo 7.5 (IBM’s SM Catalog)
 - [Definitive Guide to Jython](http://jython.org) (jython.org)
 - Python 2.x “Language Reference” (python.org)

Working with Automation Scripts

- Implicit inbound variables
 - **app**: current application name
 - **mbo**: the MBO the script is running against
 - **user**: current user's ID
- Implicit outbound variables
 - **errorgroup, errorkey, params**: used to return user-friendly error messages to the user

Demonstration
