Front and rear axle nut torque
specifications for FWD, RWD
and 4 W/D vehicles

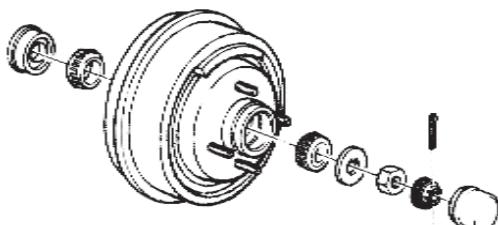

Wheel bearing adjustment procedures and torques

This book provides values to adjust or secure wheel bearings or wheel bearing units.

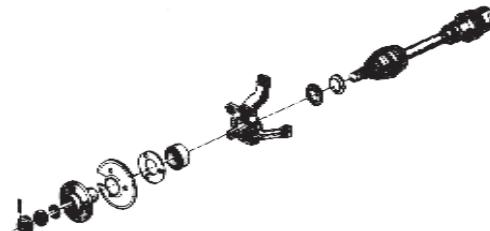

Refer to the following diagrams to determine the type of bearing being serviced and the adjustment procedure or torque.

Note: Wheel Bearing adjustment procedures listed for trucks are for models with a full-floating axle only.

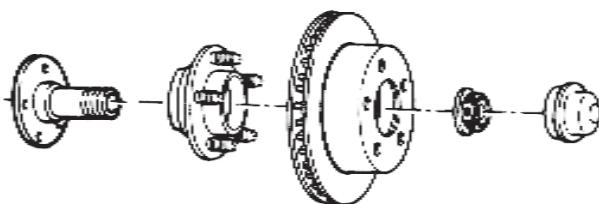

Type 1

This is a typical adjustable tapered roller bearing. If the vehicle you are working on has this type of unit, find the Make, Model, and Year on the chart. Determine the procedure code and then look it up in the Adjustment Procedures table.

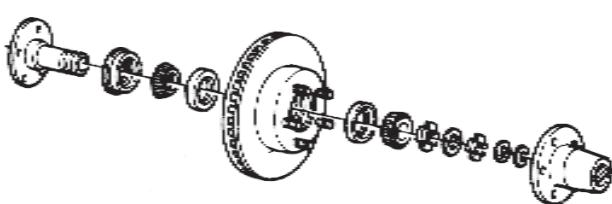

Type 2

This is the most common type of FWD bearing unit and is becoming the most common 4WD bearing unit. The hub nut securing the driveshaft to the front suspension also locks the bearing unit. Find the Make, Model, and Year on the chart. The torque for the hub nut is listed after the application.

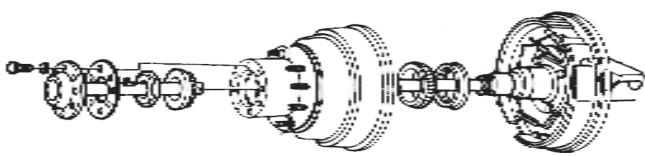

Type 3

This bearing unit is becoming more common on late model vehicles. The hub nut secures the spindle to the bearing unit. Find the Make, Model, and Year on the chart. The torque for the hub nut is listed after the application.

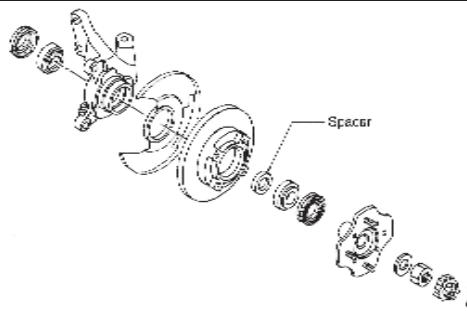

Type 4

This bearing unit is typical of many early model 4WD trucks. The bearing unit in the front spindle is adjustable. Find the Make, Model, and Year on the chart. Determine the procedure code and then look it up in the Adjustment Procedures table.

Type 5

This bearing unit represents the type found on optional full-floating rear truck axles. The bearing unit in the hub is adjustable. Find the Make, Model, and Year of truck on the chart. Determine the procedure code and then look it up in the Adjustment Procedures table.

Type 6

This type of bearing unit is used on some imported cars and is similar to Type 2. However, a spacer is used to provide proper spacing between the inner and outer bearings. Be sure to reuse the spacer if not damaged or replace it using one of the same thickness. Find the Make, Model, and year on the chart and torque the hub nut to the specified value.
